1 Notations

- $\hat{\mathbf{x}} = (\hat{x}_1, \hat{p}_1, \dots, \hat{x}_n, \hat{p}_n)^T$, vector of canonical operators.

- $\Omega = \bigoplus_{j=1}^n \Omega_1$, where $\Omega_1 = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$.

Note that, for $n = 1$, $[\hat{x}_i, \hat{x}_j] = i[\Omega_1]_{ij}$. Compactly,

$$[\hat{\mathbf{x}}, \hat{\mathbf{x}}^T] = i\Omega, \quad (\text{Canonical Commutation Relation})$$

where, think the commutation relation as element wise commutator.

- Borrowing from the optical and field-theoretical terminologies, canonical degrees of freedom are also referred to as ‘*modes*’.
- $\hat{a}_j = \frac{\hat{x}_j + i\hat{p}_j}{\sqrt{2}}$, annihilation operator.

2 Gaussian States

2.1 Quadratic Hamiltonian and Gaussian States

The most general quadratic/second-order hamiltonian can be written as follows.

$$\hat{H} = \frac{1}{2} \hat{\mathbf{x}}^T H \hat{\mathbf{x}} + \hat{\mathbf{x}}^T \xi. \quad (1)$$

Here, ξ is a $2n$ -dimensional real vector. H is a $2n \times 2n$ symmetric matrix called *Hamiltonian matrix*, not to be confused with Hamiltonian. It can always be taken as a symmetric matrix because, the antisymmetric part will give a term proportional to identity matrix due to **CCR**, which can always be discarded. If we take $\bar{\xi} = H^{-1}\xi$, then $\hat{H}' = \frac{1}{2}(\hat{\mathbf{x}} - \bar{\xi})^T H (\hat{\mathbf{x}} - \bar{\xi})$ is equivalent to \hat{H} up to some additive constant term.

Definition 1 (Gaussian State). *Gaussian states are defined as all the ground and thermal states of second-order Hamiltonians [eq.1] with positive definite Hamiltonian matrix $H > 0$.*

Thus a *Gaussian state* can be written as,

$$\rho_G = \frac{e^{-\beta \hat{H}}}{\text{Tr} [e^{-\beta \hat{H}}]}, \quad (2)$$

where, $\beta > 0$ and \hat{H} is defined in Eq. 1. Ground state is the limiting value,

$$\rho_G = \lim_{\beta \rightarrow \infty} \frac{e^{-\beta \hat{H}}}{\text{Tr} [e^{-\beta \hat{H}}]}. \quad (3)$$

Note:

- All Gaussian states are mixed state by construction, except for the ground state.
- Gaussian states are parametrized by β , ξ and H . Though β is redundant and can be absorbed into H , it allows one to single out pure Gaussian states as a limiting case like in Eq. 3.

2.2 Displacement operators

TODO: Weyl operators. Definition, properties, displacements.

Definition 2 (Weyl operators).

$$\hat{D}_{\bar{\xi}} = e^{i\bar{\xi}^T \Omega \hat{x}} \quad (4)$$

Properties:

- $\hat{D}_{-\bar{\xi}} \hat{x} \hat{D}_{\bar{\xi}} = \hat{x} - \bar{\xi}$ **Prove!**
- $\hat{D}_{-\bar{\xi}} = \hat{D}_{\bar{\xi}}^\dagger$

2.3 Evolution and Symplectic Group

TODO: Linear canonical transformation and Symplectic group, Canonical transformations are those which respect **CCR**.
